

Frontend Framework Basics (React.js) - Internship Report

This report is prepared for the Edutech Solution Full Stack Development Internship Task 4. The objective of this task is to understand the fundamentals of frontend frameworks using React.js, including components, props, and state management.

Task Name	Frontend Framework Basics
Framework Used	React.js
Concepts Covered	Components, Props, State
Tools Used	React.js, JavaScript, CSS
Outcome	Understanding of React architecture

1. Components

React applications are built using reusable components. Each component represents a part of the user interface. Functional components were used in this project.

2. Props

Props are used to pass data from one component to another. In this task, props were used to send title and description values to components.

3. State Management

React state allows components to store and update dynamic data. The useState hook was used to implement a counter component.

Project Workflow

1. Create React project structure.
2. Build reusable components.
3. Implement props and state.
4. Apply CSS styling.
5. Run and test the application.
6. Upload the project to GitHub.

Interview Questions

Q1. Virtual DOM vs Real DOM?

Virtual DOM is a lightweight copy of the real DOM. React compares changes using the virtual DOM and updates only modified elements, which improves performance.

Q2. Why use React?

React provides reusable components, fast rendering, easy state management, and better user experience for web applications.

Conclusion

This task helped in understanding the basics of frontend frameworks using React.js. The project demonstrated the implementation of reusable components, props, and state, which are core concepts in modern frontend development.
