

Task 8: Building a RESTful API with CRUD Operations

Objective

Develop a RESTful API using Node.js and Express implementing Create, Read, Update and Delete operations for product data.

Tools Used

Node.js, Express.js, Postman

Implementation

Created API endpoints for GET, POST, PUT and DELETE operations. Product data is stored in an in-memory array. Postman can be used to test all endpoints.

API Endpoints

GET /products - Retrieve all products

GET /products/:id - Retrieve a product by ID

POST /products - Add a new product

PUT /products/:id - Update an existing product

DELETE /products/:id - Delete a product

Testing

All CRUD operations were tested using Postman and returned appropriate HTTP status codes.

Interview Questions

POST vs PUT: POST creates a new resource while PUT updates an existing resource.

HTTP Status 201: Indicates a resource was successfully created.

Conclusion

Successfully developed and tested a RESTful API with CRUD functionality using Node.js and Express.
